Idea

A VR tower defense game played from a park bench. The player sits at a table with a small battlefield map laid out in front of them, and defends it by placing towers as waves of enemies march across.

Player is seated at a park bench, looking down at a table.

The tower defense map sits on the tabletop.

A shop is placed nearby on the bench, holding the towers available to buy and upgrade.

Generated using AI

Core loop

1. Enemies spawn and walk along a fixed path across the table.
2. Player reaches over to the shop, grabs a tower, and places it on an open tile near the path.
3. Towers automatically attack enemies that pass within range.
4. Killing enemies earns currency.
5. Currency is spent on more towers (or better ones or upgrades) from the shop.
6. Player loses if enemies reach the end of the path too many times.
7. Player wins by surviving all the waves.

Scope

- One map, one enemy path
- 2-3 tower types
- One enemy type (more if time allows)
- Single currency system
- Simple lives/health counter
- Basic win/lose states
